Plantuml What is it?

Plantuml What is it?

- PlantUML is an open-source tool allowing users to create diagrams from a plain text language, based on [UML](#)
- 22 April, 2009: First public release.
- Webpage [PlantUML](#)
- Wiki [PlantUML](#)
- Github [PlantUML](#)

Plantuml What is it?

- Besides various UML diagrams, PlantUML has support for various other software development related formats such as
 - Archimate,
 - Block diagram,
 - BPMN,
 - C4,
 - Computer network diagram,
 - ERD,
 - Gantt chart,
 - Mind map,
 - and WBD,
 - as well as visualisation of JSON and YAML files.

Plantuml What is it?

```
@startuml  
Bob->Alice : Hello!  
@enduml
```

Demo Link

[PlantUML Web Server](#)

Plantuml What is it?

```

@startuml
skinparam style strictuml
class Façade {
doSomething()
}
Façade .> package1.Class1
Façade .> package2.Class2
Façade .> package3.Class3
Client1 .> Façade : doSomething()
Client2 .> Façade : doSomething()
note as N2
doSomething() {
Class1 c1 = newClass1();
Class2 c2 = newClass2();
Class3 c3 = newClass3();
c1.doStuff(c2)
c3.setX(c1.getX());
return c3.getY();
}
end note
Façade .. N2
@enduml

```

Plantuml What is it?

- **Diagram As Code**
 - Diagrams are defined using a simple and intuitive language. ([see PlantUML Language Reference Guide](#)).
- **Easy to use**
 - New users can read the [quick start page](#). There is also a [F.A.Q. page](#).
- **Easy to integrate**
 - PlantUML can be used within [many other tools](#).
- **Several outputs**
 - Images can be generated in PNG, [in SVG](#) or [in LaTeX](#) format.
 - It is also possible to generate [ASCII art diagrams](#) (only for sequence diagrams).

Plantuml What is it?

PlantUML is a component that allows to quickly write:

- Sequence diagram
- Usecase diagram
- Class diagram
- Object diagram
- Activity diagram (here is the legacy syntax)
- Component diagram
- Deployment diagram
- State diagram
- Timing diagram

Plantuml What is it?

The following non-UML diagrams are also supported:

- JSON data
- YAML data
- Network diagram (nwdiag)
- Wireframe graphical interface or UI mockups (salt)
- Archimate diagram
- Specification and Description Language (SDL)
- Dita diagram
- Gantt diagram
- MindMap diagram
- Work Breakdown Structure diagram (WBS)
- Mathematic with AsciiMath or JLaTeXMath notation
- Entity Relationship diagram (IE/ER)

Plantuml What is it?

Furthermore:

- [Hyperlinks and tooltips](#)
- [Creole](#): rich text, emoticons, unicode, icons
- [OpenIconic icons](#)
- [Sprite icons](#)
- [AsciiMath](#) mathematical expressions

Plantuml When do you need it?

Plantuml When do you need it?

- Integrate application source code with its UML design
- Do not worry about visual design
- If you need something platform independent and portable
- If you need something that has lightweight diagramming features.
- If you do not want to pay for licences.
- If you do not need to install applications.
- If you need fast operations for diagramming models that you need to generate and share with others.

Plantuml When do you need it?

- There are many applications that use PlantUML.
- There are many examples of PlantUML diagrams.maybe you can find your solutions. Do not forget to check the [examples](#).

Before Start Lets Download & Install PlantUML

Download & Installation Options for Offline Usage

- Download from Direct Site and Use As *.jar File
- Install via Choco and use with Command Line

Option-1 : Download Jar File and PDF Guide

- Visit [Download page](#)
- Download Latest Version Always with GraphViz Support
 - PlantUML compiled Jar (Version 1.2022.4)
 - [From GitHub releases](#), you can download [plantuml.1.2022.4.jar](#)
 - Version without embedded GraphViz: [plantuml-nodot.1.2022.4.jar](#)
- PlantUML Language Reference Guide
 -  [English](#) [Deutsch](#) [Español](#) [Français](#) [日本語](#) [한국어](#)
[Русский](#) [中文](#)

Option-2 : Install via Choco and use with Command Line

- Choco install
 - For windows users, majkinetor introduced a way to install plantuml and its dependencies easily. Run cmd.exe as Administrator, and run two commands as follows (the first command is not needed and will fail if you already have chocolatey installed).

```
@'%SystemRoot%\System32\WindowsPowerShell\v1.0\powershell.exe' -NoProfile -ExecutionPolicy Bypass -Command "iex ((New-Object System.Net.WebClient).DownloadString('https://chocolatey.org/install.ps1'))" && SET "PATH=%PATH%;%ALLUSERSPROFILE%\chocolatey\bin"
```

```
choco install plantuml
```

- If you've installed java, but still prompts "java not installed", please add java bin path to PATH environment variable.

Always Test Installation and Its Version

Plantuml How to use it online?

Plantuml How to use it online?

- From PlantUML Web Page Select "Online Server"
- Default Online Server Link
 - <https://www.plantuml.com/plantuml/uml/SyfFKj2rKt3CoKnELR1Io4ZDoSa70000>

Plantuml How to use it online?

The screenshot shows the plantuml.com website interface. At the top, the browser address bar displays `plantuml.com/plantuml/u...`. The main content area contains a text input field with the following code:

```
@startuml
Bob -> Alice : hello
@enduml
```

A green box with the text "ENTER PLANTUML SOURCE CODE THERE" is overlaid on the input field. Below the input field, there are two buttons: "Submit" and "Decode URL". A red box with the text "SHARE THIS LINK WITH OTHERS TO EDIT DATA STORED ON THE LINK" is overlaid on the "Submit" button. A pink box with the text "COPY AND DECODE URL FROM THERE" is overlaid on the "Decode URL" button. Below the buttons, there is a dropdown menu with the text "PNG SVG ASCII Art". A blue box with the text "SUBMIT YOUR CODE" is overlaid on the "Submit" button. A green box with the text "DIRECT IMAGE LINKS" is overlaid on the dropdown menu. Below the dropdown menu, there is a statistics bar with the following text: "online diagrams 121,370,939", "current rate 364 diag. per minute", and "peak rate 899 diag. per minute". Below the statistics bar, there is a UML diagram showing two nodes, "Bob" and "Alice", connected by a message arrow labeled "hello". A blue box with the text "UML IMAGE OUTPUT" is overlaid on the diagram.

Plantuml How to use it online?

- **You can download get shareable PNG, SVG links from server**
- You can access directly UML diagram via browser
- You can parse links from server to get editable diagram
- You can try several built-in themes
- You can separate diagram window from code window to make easier to edit diagram

Plantuml How to use it online?

- Everything stored on link, example
- Request URL

```
https://www.plantuml.com/plantuml/uml/SyfFKj2rKt3CoKnELR1Io4ZDoSa70000
```

Plantuml How to use it online?

- Server Base URL

```
https://www.plantuml.com/plantuml/uml/
```

- Encoded PlantUML Script

```
SyfFKj2rKt3CoKnELR1Io4ZDoSa70000
```

- Decoded PlantUML Script

```
``` plantuml
@startuml
Bob -> Alice : hello
@enduml
```

## Plantuml How to use it online?

- If you plantuml text-encoding features <https://plantuml.com/text-encoding>
- They use
  - <https://en.wikipedia.org/wiki/Deflate> (LZ77 + Huffman)
  - <https://en.wikipedia.org/wiki/Brotli> (LZ77)

# Plantuml How to use it online?

## Plantuml.jar Console-Command

You can use `-encodeurl` or `-decodeurl` in the **command line** flags to encode or decode the text.

```
@startuml
Bob -> Alice : hello
@enduml
```

```
C:\Users\ugur.coruh\Desktop\plantuml>java -jar plantuml.jar -encodeurl hello.puml
SyfFKj2rKt3CoKnELR1Io4ZDoSa70000
C:\Users\ugur.coruh\Desktop\plantuml>
```

- <https://www.plantuml.com/plantuml/uml/SyfFKj2rKt3CoKnELR1Io4ZDoSa70000>

## Plantuml How to use it online?

You will find here some implementation of this encoder:

- [Code in PHP](#)
- [Code in Javascript](#)
- [Code in Python](#)
- [Code in Swift](#)

## Plantuml How to use it online?

### Javascript Encoder & Decoder Library

- You can use following libraries to encode/decode URLs with you app.
  - <https://github.com/markshedvall/plantuml-encoder>
  - <https://www.npmjs.com/package/plantuml-encoder-decoder>

## Plantuml How to use it online?

### Javascript Encoder Example

```
var plantumlEncoder = require('plantuml-encoder')

var encoded = plantumlEncoder.encode('A -> B: Hello')
console.log(encoded) // SrJGjLDmibBmICt9oGS0

var url = 'http://www.plantuml.com/plantuml/img/' + encoded

var decoded = plantumlEncoder.decode(encoded)
console.log(decoded)
```

## Plantuml How to use it online?

### Javascript Decoder Example

```
var plantumlEncoder = require('plantuml-encoder')

var plain = plantumlEncoder.decode('UDfpLD2rKt2oKl18pSd91m0KGWDz')
console.log(plain) // A -> B: Hello
```

## Simple HEX format

- If you find Deflate and Brotli too complex, you can try the HEX format. In that case, you just have to encode each character in hexadecimal format.
- For example :

```
@startuml
Alice->Bob : I am using hex
@enduml
```

- will be turned into:

```
407374617274756d6c0a416c6963652d3e426f62203a204920616d207573696e67206865780a40656e64756d6c
```

- To indicate the use of HEX format, you must add `~h` at the start of the data sent to PlantUML server.

- <http://www.plantuml.com/plantuml/uml/~h4073...>

- Since there is no compression here, the URL will become very long as the diagram grows.

## Plantuml How to use it online?

### PNG service

To get a PNG file of a diagram, use the following URL scheme: [/plantuml/png/ENCODED](#)

## Plantuml How to use it online?

### SVG service

To get a SVG XML file of a diagram, use the following URL scheme: [/plantuml/svg/ENCODED](#)

Note that not all diagrams can be produced in [SVG](#). For example, [ditaa diagrams](#) are only available in PNG format.

## Plantuml How to use it online?

### ASCII Art Service

To get an ASCII Art representation of a diagram, encoded in UTF-8, use the following URL scheme: [/plantuml/txt/ENCODED](#)

Note that only sequence diagrams can be produced in ASCII Art.

## Plantuml How to use it online?

### Image Map service

To get the [client image map](#) related to a previously generated PNG image, use the following URL scheme: [/plantuml/map/ENCODED](#)

# Plantuml How to use it online?

## Image Map service

The output is a list of `<area>` tags, each line matching a link present in the diagram description.

For example, the following [diagram](#):

```
@startuml
participant Bob [[http://plantuml.com]]
Bob -> Alice : [[http://forum.plantuml.net]] hello
@enduml
```

produces the [following output](#):

```
<map id="plantuml_map" name="plantuml_map">
<area shape="rect" id="id1" href="http://forum.plantuml.net" title="http://forum.plantuml.net" alt="" coords="38,50,199,65"/>
<area shape="rect" id="id2" href="http://plantuml.com" title="http://plantuml.com" alt="" coords="8,3,50,116"/>
</map>
```

## Plantuml How to use it online?

Note that you need to include these `<area...>` tags inside a `<map...>` html tag to make the complete image map.

```
<!DOCTYPE html>
<html lang="en">
<head>
 <title>Plantuml Image Map</title>
 <meta charset="UTF-8" >
 <meta name="keywords" content="Plantuml,ImageMap">
 <meta name="description" content="Plantuml Image Map">
 <meta name="author" content="Uğur CORUH">
</head>
<body>
 <!-- -->
 <h1>Sample Image</h1>

 <map id="plantuml_map" name="plantuml_map">
 <area shape="rect" id="id1" href="http://forum.plantuml.net" title="http://forum.plantuml.net" alt="" coords="38,50,199,65"/>
 <area shape="rect" id="id2" href="http://plantuml.com" title="http://plantuml.com" alt="" coords="8,3,50,116"/>
 </map>
</body>
</html>
```

# Plantuml How to use it online?

## Proxy Service

With the proxy service, the source description of the diagram can be fetched by the PlantUML Server from a remote document.

The proxy service uses the following URL scheme: `/plantuml/proxy?`

`src=RESOURCE&idx=INDEX&fmt=FORMAT`

- RESOURCE is the complete URL of the document which contains the diagram description (with the `@startxxx` and `@endxxx` tags), it could be a `.html` or a `.txt` file.
- INDEX is optional, it specifies the occurrence (starting at 0) of the diagram description that will be parsed when there are more than one diagram descriptions in the remote document. It defaults to zero.
- FORMAT is optional, it specifies the format to return. Supported values are: `png`, `svg`, `eps`, `epstext` and `txt`. Default is `png`,

## Plantuml How to use it online?

### Proxy Service

For example, try this link: <http://www.plantuml.com/plantuml/proxy?src=https://raw.githubusercontent.com/plantuml/plantuml-server/master/src/main/webapp/resource/test2diagrams.txt>

Note that the address of the remote document is specified as a parameter, so it is not necessary to [URL encode](#) the URL.

# Plantuml How to use it offline?

# Plantuml How to use it offline?

## PlantUML PicoWeb Server

- <https://plantuml.com/picoweb>
- Many plugins take advantage of the online web server to generate images.
- For some reasons (security, performance...) you may need to use your own local server instead. This is possible thanks to the PlantUML Server which is available here.
- However, installing and configuring a full webserver may be too complex for some users so we have decided to integrate a tiny webserver inside plantuml.jar.
- This means that you only need a Java Runtime Environment and plantuml.jar to run this very simple web server.

# Plantuml How to use it offline?

## PlantUML PicoWeb Server

- <https://plantuml.com/picoweb>
- Running the server
  - Running the server is pretty simple. You just have to launch:

```
java -jar plantuml.jar -picoweb
```

- Attention: By default, the server listens on all interfaces on port 8080.
- To change the default behavior, you can specify a colon separated port (still listening on all interfaces) or, both, a port and a bind address:

```
java -jar plantuml.jar -picoweb:8000
java -jar plantuml.jar -picoweb:8000:127.0.0.1
```

# Plantuml How to use it offline?

## PlantUML PicoWeb Server

- <https://plantuml.com/picoweb>
- Running the server
  - The server is really basic. It only understands GET requests with following patterns:

```
/plantuml/png/xyz....
/plantuml/svg/xyz....
```

- The server will return a PNG or SVG image.
- The server will return a 404 error if the request is not understood.
- The server will return a 500 error if the image cannot be generated.

## Plantuml How to use it offline?

### PlantUML PicoWeb Server

- Those GET requests are used by various PlantUML plugins. Once you have launched your server, you can simply test it. With any web browser, you just have to point to: <http://127.0.0.1:8080>.
- This way, you can very easily use any plugins which need some PlantUML HTTP server without the official online server.

## Plantuml How to use it offline?

### PlantUML Server

- You can use PlantUML using the online web service to generate images on-the-fly. A online demonstration is available at <http://www.plantuml.com/plantuml>, but you can also install it on your own JEE web application server.
- **Full featured server is available here:**
  - <https://plantuml.com/server>

## Plantuml How to use it offline?

### PlantUML Server

- To install PlantUML Server on your own JEE 5 web server,
  - download the plantuml.war file and copy it on the webapp folder of your server.
- Because of the transition from javax.\* to jakarta.\*, the PlantUML Server does not work on Tomcat 6/7/8/9 anymore. You have to use Tomcat 10.

## Plantuml How to use it offline?

- Download and install Java Runtime Environment (JRE) or Java Development Kit (JDK) with JRE.
- Download jar file from <https://plantuml.com/download>
- Select Latest version plantuml.jar with graphviz support.
- Prepare a batch file to launch on your computer as follow in the same folder with plantuml.jar
- for PNG image output run **run\_plantuml\_for\_png\_export.bat**

```
java -DPLANTUML_LIMIT_SIZE=8192 -jar "plantuml.jar" -v "**.(puml)"
```

- for SVG output run **run\_plantuml\_for\_svg\_export.bat**

```
java -DPLANTUML_LIMIT_SIZE=8192 -jar "plantuml.jar" -svg -v "**.(puml)"
```

- This scripts are look for folders and find \*.puml files and generate PNG or SVG images.

## Plantuml How to use it offline?

- Other options

The most basic way to run it is:

```
java -jar plantuml.jar file1 file2 file3
```

This will look for `@startXYZ` into `file1`, `file2` and `file3`. For each diagram, a `.png` file will be created.

## Plantuml How to use it offline?

For processing a whole directory, you can use:

```
java -jar plantuml.jar "c:/directory1" "c:/directory2"
```

This command will search

for `@startXYZ` and `@endXYZ` into `.txt`, `.tex`, `.java`, `.htm`, `.html`, `.c`, `.h`, `.cpp`, `.apt`, `.pu`, `.puml`, `.hpp`, `.hh` or `.md` files of the `c:/directory1` and `c:/directory2` directories.

## Plantuml How to use it offline?

### Configuration File

- You can also provide a configuration file which will be included before each diagram:

```
java -jar plantuml.jar -config "./config.cfg" dir1
```

# Plantuml How to use it offline?

## Configuration File

- Suppose you have the two following files:

**test1.txt:**

```
@startuml
Alice->Bob : hello
@enduml
```

**config.txt:**

```
skinparam handwritten true
```

- If you launch the following command:

```
java -jar plantuml.jar -config config.txt test1.txt
```

- File `config.txt` is automatically included at the very beginning of the diagram.

# Plantuml How to use it offline?

## Metadata

- PlantUML saves the diagram's source code in the generated PNG Metadata in the form of **encoded text**.
- So it is possible to retrieve this source by using the query parameter `metadata` , giving it some image URL.
- For example, if you want to retrieve the diagram source of the image `http://i.stack.imgur.com/HJvKF.png` use the following server request:
  - `http://www.plantuml.com/plantuml/?metadata=http://i.stack.imgur.com/HJvKF.png` .
- Sounds like magic! No, merely clever engineering :-)

## Plantuml How to use it offline?

### Metadata

After all preprocessing (includes etc), PlantUML saves the diagram's source code in the generated PNG Metadata in the form of [encoded text](#).

- If you does not want plantuml to save the diagram's source code in the generated PNG Metadata, you can during generation use the option `-nometadata` to disable this functionality (To NOT export metadata in PNG/SVG generated files).
- It is possible to retrieve this source with the `-metadata` option. This means that the PNG is almost "editable": you can post it on a corporate wiki where you cannot install plugins, and someone in the future can update the diagram by getting the metadata, editing and re-uploading again. Also, the diagram is stand-alone.

# Plantuml How to use it offline?

## Metadata

- Conversely, the `-checkmetadata` option checks whether the target PNG has the same source and if there are no changes, doesn't regenerate the PNG, thus saving all processing time. This allows you to run PlantUML on a whole folder (or tree with the `-recursive` option) incrementally.

Sounds like magic! No, merely clever engineering :-)

Example:

```
java -jar plantuml.jar -metadata diagram.png > diagram.puml
```

Unfortunately this option works only with local files. It doesn't work with `-pipe` so you cannot fetch a URL with eg `curl` and feed the PNG to PlantUML.

However, the Plantuml [server](#) has a similar feature, where it can get a PNG from a URL and extract its metadata.

# Plantuml How to use it offline?

## Command line

You can run PlantUML using the command line. (See [running](#) for ways to run PlantUML from various other tools and workflows). The most basic way to run it is:

```
java -jar plantuml.jar file1 file2 file3
```

This will look for `@startXYZ` into `file1`, `file2` and `file3`. For each diagram, a `.png` file will be created. For processing a whole directory, you can use:

```
java -jar plantuml.jar "c:/directory1" "c:/directory2"
```

This command will search

for `@startXYZ` and `@endXYZ` into `.txt`, `.tex`, `.java`, `.htm`, `.html`, `.c`, `.h`, `.cpp`, `.apt`, `.pu`, `.pum1`, `.hpp`, `.hh` or `.md` files of the `c:/directory1` and `c:/directory2` directories.

# Plantuml How to use it offline?

## Wildcards

You can also use wildcards :

- For a single character, use `?`
- For zero or more characters, use `*`
- For zero or more characters, (including `/` or `\`), use a double `**`

So to process any `.cpp` files in all directories starting by *dummy* :

```
java -jar plantuml.jar "dummy*/*.cpp"
```

And to process any `.cpp` files in all directories starting by *dummy*, and theirs subdirectories :

```
java -jar plantuml.jar "dummy/**/*.cpp"
```

## Plantuml How to use it offline?

### Excluded files

You can exclude some files from the process using the `-x` option:

```
java -jar plantuml.jar -x "**/common/**" -x "**/test/Test*" "dummy*/**/*.cpp"
```

# Plantuml How to use it offline?

## Output Directory

You can specify an output directory for all images using the `-o` switch:

```
java -jar plantuml.jar -o "c:/outputPng" "c:/directory2"
```

If you recurse into several directory, there is a slight difference if you provide an absolute or a relative path for this output directory:

- An absolute path will ensure that all images are output to a single, specific, directory.
- If you provide a relative path then the images is placed in that directory relative to the location of the **input file**, not the current directory (note: this applies even if the path begins with a `.` ).  
When Plantuml processes files from multiple directories then the corresponding directory structure is created under the computed output directory.

## Plantuml How to use it offline?

### Types of Output File

Images for your diagrams can be exported in a variety of different formats. By default the format will be a PNG file but another type can be selected using the following extensions:

Example:

```
java -jar plantuml.jar yourdiagram.txt -ttxt
```

## Plantuml How to use it offline?

### Types of Output File

Param name	Short param name	Output format	Comment
-tpng	-png	PNG	Default
-tsvg	-svg	SVG	Further details can be found <a href="#">here</a>
-teps	-eps	EPS	Further details can be found <a href="#">here</a>

## Plantuml How to use it offline?

### Types of Output File

Param Name	Short Param Name	Output Format	Comment
<code>-teps:text</code>	<code>-eps:text</code>	EPS	This option keeps text as text
<code>-tpdf</code>	<code>-pdf</code>	PDF	Further details can be found <a href="#">here</a>
<code>-tvdx</code>	<code>-vdx</code>	VDX	Microsoft Visio Document

## Plantuml How to use it offline?

### Types of Output File

Param Name	Short Param Name	Output Format	Comment
<code>-txmi</code>	<code>-xmi</code>	XMI	Further details can be found <a href="#">here</a>
<code>-tscxml</code>	<code>-scxml</code>	SCXML	
<code>-thtml</code>	<code>-html</code>	HTML	Alpha feature: do not use

## Plantuml How to use it offline?

### Types of Output File

Param Name	Short Param Name	Output Format	Comment
<code>-ttxt</code>	<code>-txt</code>	ATXT	ASCII art. Further details can be found <a href="#">here</a>
<code>-tutxt</code>	<code>-utxt</code>	UTXT	ASCII art using Unicode characters
<code>-tlatex</code>	<code>-latex</code>	LATEX	Further details can be found <a href="#">here</a>

## Plantuml How to use it offline?

### Types of Output File

Param Name	Short Param Name	Output Format	Comment
- tlatex:nopreamble	- latex:nopreamble	LATEX	Contains no LaTeX preamble creating a document
-tbraille	-braille	PNG	Braille image [Ref. <a href="#">QA-4752</a> ]

## Plantuml How to use it offline?

### Exit Code

- When there are some errors in diagrams the command returns an error (-1) exit code. But even if some diagrams contain some errors, **all** diagrams are generated, which can be time consuming for large project.
- You can use the `-failfast` flag to change this behavior to stop diagram generations as soon as one error occurs. In that case, some diagrams will be generated, and some will not.
- There is also a `-failfast2` flag that does a first checking pass. If some error is present, no diagram will be generated at all. In case of error, `-failfast2` runs even faster than `-failfast`, which may be useful for huge project.

## Plantuml How to use it offline?

### Standard report [stdrpt]

Using the `-stdrpt` (standard report) option, you can change the format of the error output of your PlantUML scripts.

With this option, a different error output of your diagram is possible:

- none: two lines
- `-stdrpt` : single line
- `-stdrpt:1` : verbose
- `-stdrpt:2` : single line

[Ref. [Issue#155](#) and [QA-11805](#)]

## Plantuml How to use it offline?

### Standard report [stdrpt]

Examples, with the bad file `file1.pu` , where `as` is written `aass` :

```
@startuml
participant "Famous Bob" aass Bob
@enduml
```

## Plantuml How to use it offline?

### Standard report [stdrpt]

#### Without any option

```
java -jar plantuml.jar file1.pu
```

The error output is:

```
Error line 2 in file: file1.pu
Some diagram description contains errors
```

## Plantuml How to use it offline?

### Standard report [stdrpt]

#### -stdrpt option

```
java -jar plantuml.jar -stdrpt file1.pu
```

The error output is:

```
file1.pu:2:error:Syntax Error?
```

## Plantuml How to use it offline?

### Standard report [stdrpt]

#### -stdrpt:1 option

```
java -jar plantuml.jar -stdrpt:1 file1.pu
```

The error output is:

```
protocolVersion=1
status=ERROR
lineNumber=2
label=Syntax Error?
Error line 2 in file: file1.pu
Some diagram description contains errors
```

## Plantuml How to use it offline?

### Standard report [stdrpt]

-stdrpt:2 option (like -stdrpt)

```
java -jar plantuml.jar -stdrpt:2 file1.pu
```

The error output is:

```
file1.pu:2:error:Syntax Error?
```

## Plantuml How to use it offline?

### Command-Line Options and Help

You can have a help message by launching :

```
java -jar plantuml.jar -help
```

# Plantuml How to use it offline?

## Command-Line Options and Help

This will output:

```
Usage: java -jar plantuml.jar [options] -gui
 (to execute the GUI)
 or java -jar plantuml.jar [options] [file/dir] [file/dir] [file/dir]
 (to process files or directories)
```

You can use the following wildcards in files/dirs:

```
* means any characters but '\'
? one and only one character but '\'
** means any characters (used to recurse through directories)
```

# Plantuml How to use it offline?

## Command-Line Options and Help

where options include:

- gui To run the graphical user interface
- tpng To generate images using PNG format (default)
- tsvg To generate images using SVG format
- teps To generate images using EPS format
- tpdf To generate images using PDF format
- tvdX To generate images using VDX format
- txmi To generate XMI file for class diagram
- tscxml To generate SCXML file for state diagram
- thtml To generate HTML file for class diagram

## Plantuml How to use it offline?

### Command-Line Options and Help

<code>-ttxt</code>	To generate images with ASCII art
<code>-tutxt</code>	To generate images with ASCII art using Unicode characters
<code>-tlatex</code>	To generate images using LaTeX/Tikz format
<code>-tlatex:nopreamble</code>	To generate images using LaTeX/Tikz format without preamble
<code>-o[output] "dir"</code>	To generate images in the specified directory
<code>-DVAR1=value</code>	To set a preprocessing variable as if '!define VAR1 value' were used
<code>-Sparam1=value</code>	To set a skin parameter as if 'skinparam param1 value' were used

# Plantuml How to use it offline?

## Command-Line Options and Help

<code>-Ppragma1=value</code>	To set pragma as if <code>!pragma pragma1 value</code> were used
<code>-I\path\to\file</code>	To include file as if <code>!include file</code> were used
<code>-I\path\to\*.puml</code>	To include files with pattern
<code>-theme xxx</code>	To use a specific theme
<code>-charset xxx</code>	To use a specific charset (default is windows-1251)
<code>-e[x]clude pattern</code>	To exclude files that match the provided pattern
<code>-metadata</code>	To retrieve PlantUML sources from PNG images
<code>-nometadata</code>	To NOT export metadata in PNG/SVG generated files
<code>-checkmetadata</code>	Skip PNG files that don't need to be regenerated
<code>-version</code>	To display information about PlantUML and Java versions
<code>-v[erbose]</code>	To have log information

# Plantuml How to use it offline?

## Command-Line Options and Help

```
-quiet To NOT print error message into the console
-debugsvk To generate intermediate svk files
-h[elp] To display this help message
-testdot To test the installation of graphviz
-graphvizdot "exe" To specify dot executable
-p[ipe] To use stdin for PlantUML source and stdout for PNG/SVG/EPS generation
-encodesprite 4|8|16[z] "file" To encode a sprite at gray level (z for compression) from an image
-computeurl|-encodeurl To compute the encoded URL of a PlantUML source file
-decodeurl To retrieve the PlantUML source from an encoded URL
```

# Plantuml How to use it offline?

## Command-Line Options and Help

-syntax	To report any syntax error from standard input without generating images
-language	To print the list of PlantUML keywords
-checkonly	To check the syntax of files without generating images
-failfast	To stop processing as soon as a syntax error in diagram occurs
-failfast2	To do a first syntax check before processing files, to fail even faster
-noerror	To skip images when error in diagrams
-duration	To print the duration of complete diagrams processing
-nbthread N	To use (N) threads for processing
-nbthread auto	To use 4 threads for processing
-timeout N	Processing timeout in (N) seconds. Defaults to 15 minutes (900 seconds).

# Plantuml How to use it offline?

## Command-Line Options and Help

<code>-author[s]</code>	To print information about PlantUML authors
<code>-overwrite</code>	To allow to overwrite read only files
<code>-printfonts</code>	To print fonts available on your system
<code>-enablestats</code>	To enable statistics computation
<code>-disablestats</code>	To disable statistics computation (default)
<code>-htmlstats</code>	To output general statistics in file <code>plantuml-stats.html</code>
<code>-xmlstats</code>	To output general statistics in file <code>plantuml-stats.xml</code>
<code>-realtimestats</code>	To generate statistics on the fly rather than at the end
<code>-loopstats</code>	To continuously print statistics about usage
<code>-splash</code>	To display a splash screen with some progress bar
<code>-progress</code>	To display a textual progress bar in console

# Plantuml How to use it offline?

## Command-Line Options and Help

```
-pipeimageindex N To generate the Nth image with pipe option
-stdlib To print standard library info
-extractstdlib To extract PlantUML Standard Library into stdlib folder
-filedir xxx To behave as if the PlantUML source is in this dir (only affects '-pipe' and PicoWeb 'POST /render')
-filename "example.puml" To override %filename% variable
-preproc To output preprocessor text of diagrams
-cypher To cypher texts of diagrams so that you can share them
-picoweb To start internal HTTP Server. See https://plantuml.com/picoweb
```

- If needed, you can setup the environment variable GRAPHVIZ\_DOT

## Plantuml Integrations with other tools

### Plantuml How to integrate with Doxygen?

- Plantuml search for @startuml and @enduml tags in your source code and generate the diagram.
- You need to specify the output directory for the generated images in the Doxygen configuration file with the environment variable **DOC\_IMG\_PATH\_UML**.
- First plantuml runs the source code through the PlantUML compiler and generates the images.
- Then doxygen runs the source code through the Doxygen preprocessor and generates the documentation.

## Plantuml Integrations with other tools

### Plantuml How to integrate with Doxygen?

- Folder structure should be as follow

- app

- src

- *main.cpp*

- doxygen

- Resouces

- DoxyFile

- doxy\_run.bat

- plantuml.jar

- Example Application

- <https://github.com/ucoruh/ce103-hw2->

- [template/tree/f3e17bc466b4b4db50625ab6c8aee884fbe4345f/doxygen](https://github.com/ucoruh/ce103-hw2-template/tree/f3e17bc466b4b4db50625ab6c8aee884fbe4345f/doxygen)

## Plantuml Integrations with other tools

Plantuml Integrations with other tools

Plantuml How to integrate with Doxygen?

Built-in Feature

- <https://www.doxygen.nl/manual/commands.html#cmdstartuml>

`\startuml ['{option[,option]}'] ["caption"] [=]`

- Starts a text fragment which should contain a valid description of a PlantUML diagram.
 - See <https://plantuml.com/> for examples. The text fragment ends with `\enduml`.

Plantuml Integrations with other tools

Plantuml How to integrate with Doxygen?

Built-in Feature

Note

- You need to install Java and the PlantUML's jar file, if you want to use this command. When using PlantUML in `LATEX` you have to download some more `jar` files,
- for details see the PlantUML documentation. This also is valid for the `<engine> s latex` and `math`.
- The location of the PlantUML file should be specified using `PLANTUML_JAR_PATH`. The other jar files should also reside in this directory.

Plantuml How to integrate with Doxygen?

Built-in Feature

- The use of the `<engine> ditaa` is not possible in $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ as PlantUML only supports the `png` format and doxygen requires, temporary, `eps` output.
- Not all diagrams can be created with the PlantUML `@startuml` command but need another PlantUML `@start...` command.
- This will look like `@start<engine>` where currently supported are the following `<engine> S: uml, bpm, wire, dot, ditaa, salt, math, latex, gantt, mindmap, wbs, yaml, creole, json, flow, board and git`. By default the `<engine>` is `uml`. The `<engine>` can be specified as an option.
- Also the file to write the resulting image to can be specified by means of an option, see the description of the first (optional) argument for details. Of course only one `<engine>` can be specified and also the filename can only be specified once.

Plantuml Integrations with other tools

Plantuml How to integrate with Doxygen?

Built-in Feature

- The first argument is optional and is for compatibility with running PlantUML as a preprocessing step before running doxygen, you can also add the name of the image file after `\startuml` and inside curly brackets as option, i.e.

```
@startuml{myimage.png} "Image Caption" width=5cm  
Alice -> Bob : Hello  
@enduml
```

- When the name of the image is specified, doxygen will generate an image with that name. Without the name doxygen will choose a name automatically.

Plantuml Integrations with other tools

Plantuml How to integrate with Doxygen?

Built-in Feature

- The second argument is optional and can be used to specify the caption that is displayed below the image. This argument has to be specified between quotes even if it does not contain any spaces. The quotes are stripped before the caption is displayed.
- The third argument is also optional and can be used to specify the width or height of the image. For a description of the possibilities see the paragraph [Size indication](#) with the `\image` command.

Plantuml Integrations with other tools

Plantuml How to integrate with Doxygen?

Built-in Feature

Note

- doxygen creates a temporary file that is automatically removed unless the `DOT_CLEANUP` tag is set to `NO`.

Plantuml Integrations with other tools

Plantuml How to integrate with Doxygen?

Built-in Feature

Here is an example of the use of the `\startuml` command.

```
/** Sender class. Can be used to send a command to the server.  
* The receiver will acknowledge the command by calling Ack().  
* \startuml  
* Sender->Receiver : Command()  
* Sender<--Receiver : Ack()  
* \enduml  
*/
```

Plantuml Integrations with other tools

Plantuml How to integrate with Doxygen?

Built-in Feature

```
class Sender
{
public:
/** Acknowledgment from server */
void Ack(bool ok);
};
```

Plantuml Integrations with other tools

Plantuml How to integrate with Doxygen?

Built-in Feature

```
/** Receiver class. Can be used to receive and execute commands.  
 * After execution of a command, the receiver will send an acknowledgment  
 * \startuml  
 * Receiver<-Sender : Command()  
 * Receiver-->Sender : Ack()  
 * \enduml  
 */
```

Plantuml Integrations with other tools

Plantuml How to integrate with Doxygen?

Built-in Feature

```
class Receiver
{
public:
/** Executable a command on the server */
void Command(int commandId);
};
```

Plantuml Integrations with other tools

Plantuml How to integrate with Eclipse?

Information about the PlantUML Eclipse Plugin

- The Eclipse Plugin is developed and maintained by [Hallvard Trætteberg](#) (many thanks for his work!).
- Like the core library PlantUML itself, it is *open source* and the plugin is distributed under EPL license.
- The source code [is hosted on GitHub](#).

Plantuml Integrations with other tools

Plantuml How to integrate with Eclipse?

How to use it?

- First, you have to display the *PlantUML View* (click the *Window* menu):

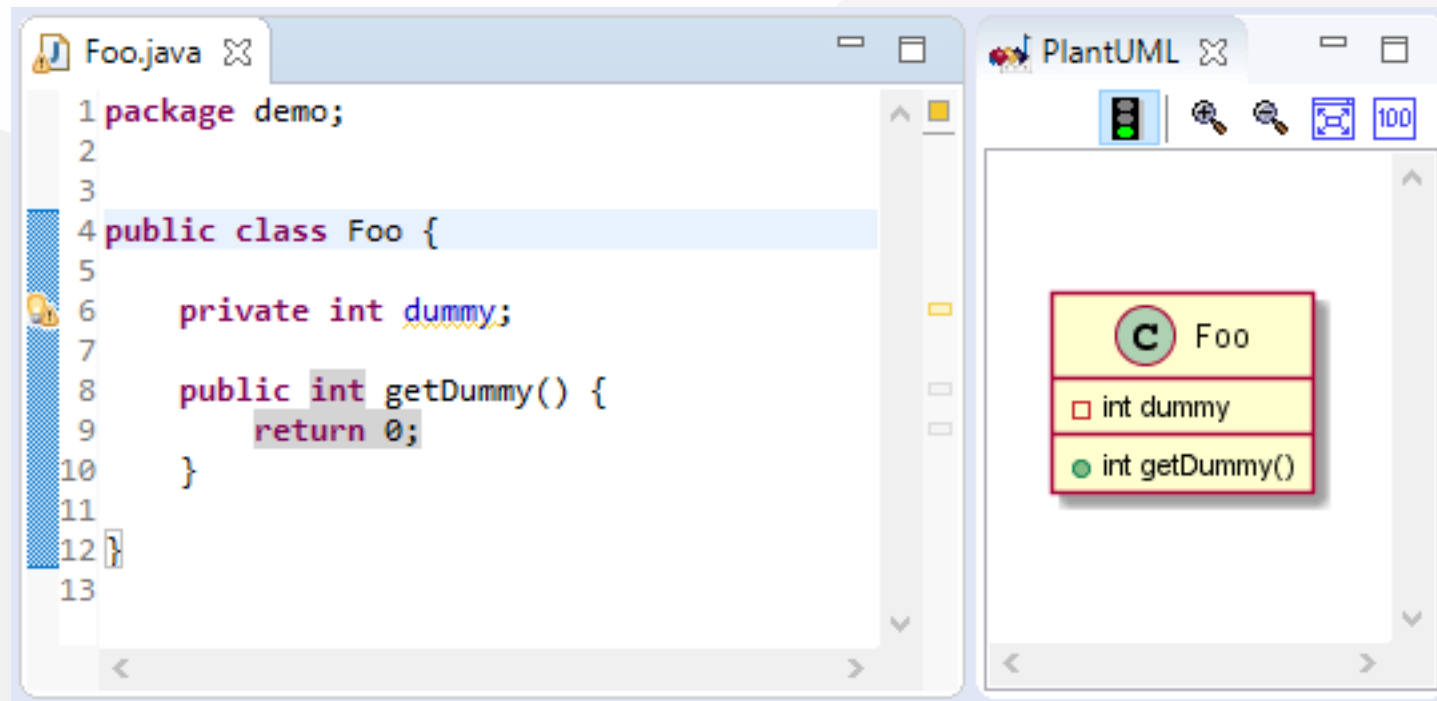

Plantuml Integrations with other tools

Plantuml How to integrate with Eclipse?

How to use it?

This view displays automatically the class you are working on:

Plantuml Integrations with other tools

Plantuml How to integrate with Eclipse?

How to use it?

If you write some comment in *PlantUML language*, the corresponding diagram is automatically displayed. And if you have several comments with diagrams, it selects the one the cursor is in.

The screenshot shows two windows from the Eclipse IDE. The left window, titled 'Foo.java', contains the following code:

```
1 package demo;
2
3 /**
4  * @startuml
5  * Alice -> Bob : Hello
6  * Bob --> Alice : Hello too
7  * @enduml
8  *
9  */
10 public class Foo {
11
12     private int dummy;
13
14     public int getDummy() {
15         return 0;
16     }
17 }
```

The right window, titled 'PlantUML', displays a sequence diagram with two lifelines, Alice and Bob. Alice sends a message 'Hello' to Bob, and Bob returns a message 'Hello too' to Alice. A context menu is open over the diagram, showing the following options:

- Copy
- Copy source
- Copy as ASCII art
- Export
- Print

Plantuml Integrations with other tools

Plantuml How to integrate with Eclipse?

How to use it?

In the *Preferences* Windows, you can also set up [GraphViz path](#) if needed:

Plantuml Integrations with other tools

Plantuml How to integrate with Eclipse?

How to install it?

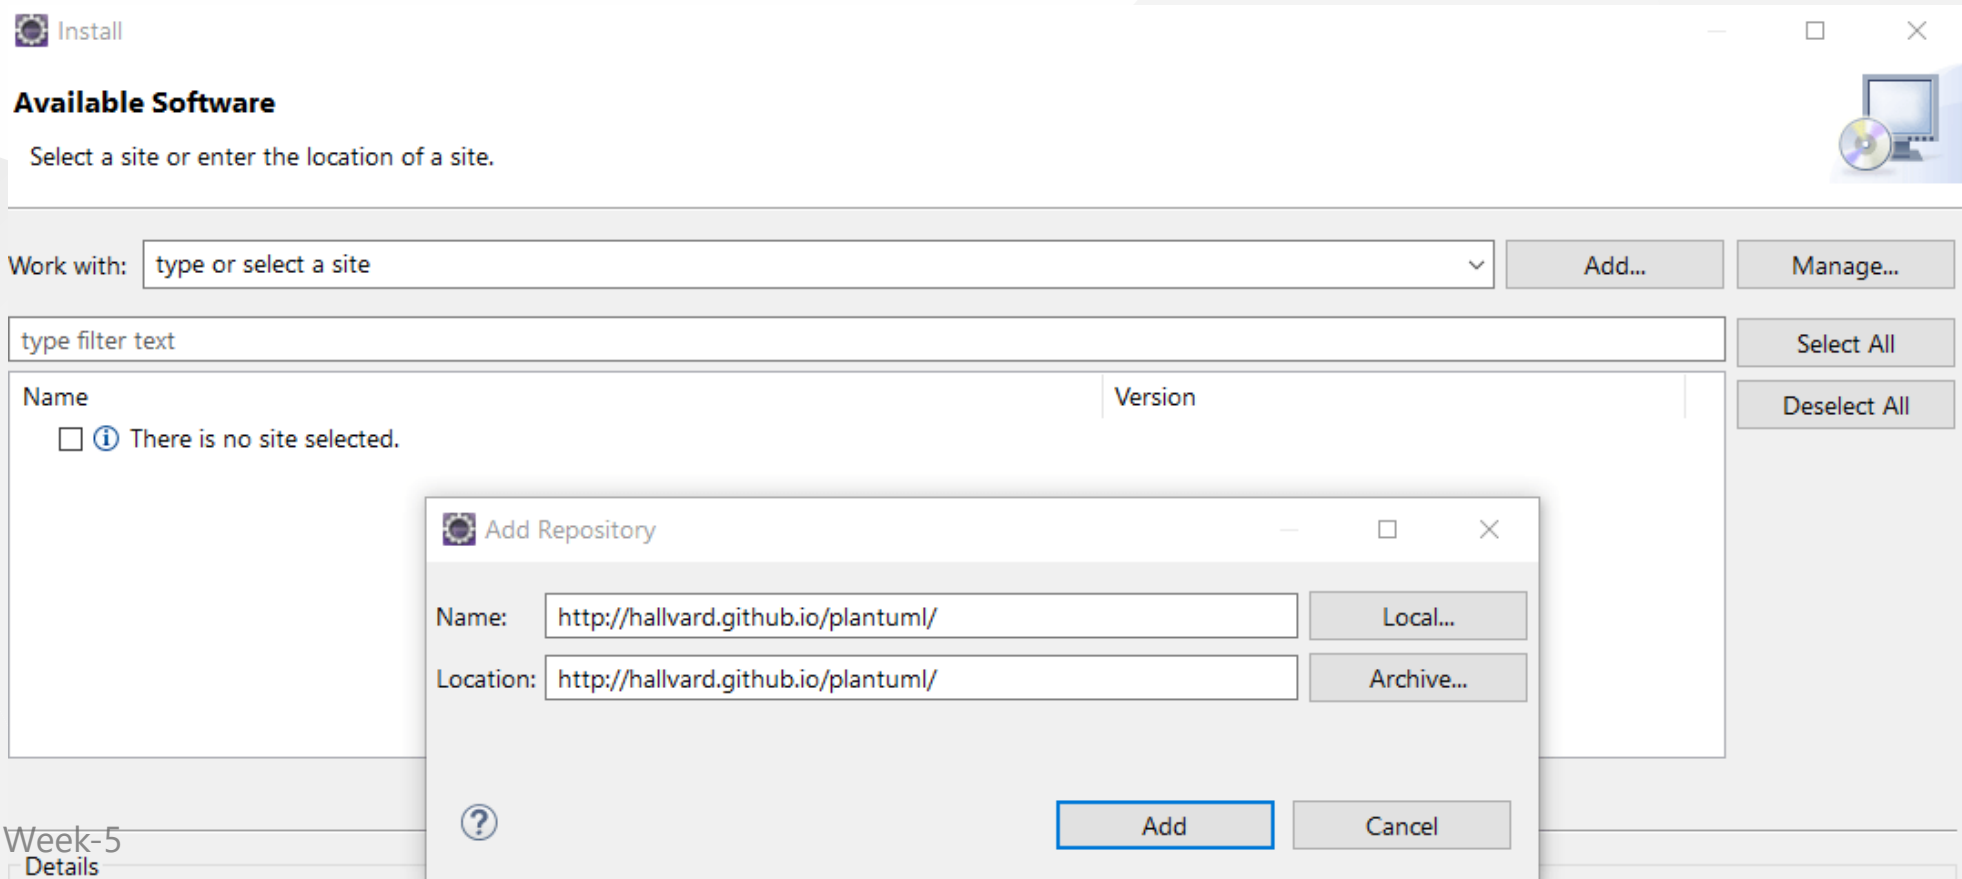

To install the plugin, you have to:

- Go to **Help/Software Update/Find and install...** or **Help/Install new software...**
- Create (if needed) or choose the following site as update site: `http://hallvard.github.io/plantuml/`

Plantuml How to integrate with Eclipse?

How to install it?

- Add Repository `http://hallvard.github.io/plantuml/` to Eclipse

Plantuml Integrations with other tools

Plantuml How to integrate with Eclipse?

How to install it?

- Select PlantUML features:

Plantuml Integrations with other tools

Plantuml How to integrate with Eclipse?

How to improve it?

The plugin is not limited to Java source file, it also works with *Ecore*/Xcore** files.

So that you can see the corresponding class diagram in a view side-by-side the *Ecore*/Xcore** editor :

The screenshot displays two windows side-by-side. The left window, titled 'xwordfeud.xcore', shows Java source code for a word game engine. The code includes methods for calculating points, string conversion, and game logic. The right window, titled 'PlantUML', shows a UML class diagram that is automatically generated from the source code. The diagram features several classes: **AbstractBoard** (abstract), **BoardWord**, **Round**, **Piece**, **BoardSetup**, **AbstractRound**, **AbstractBoardSetup**, **BoardPiece**, **BoardPieces**, **BoardSetup**, **Pieces**, **BoardWord**, **Round**, **Piece**, **BoardSetup**, **AbstractRound**, **AbstractBoardSetup**, **BoardPiece**, **BoardPieces**, **BoardSetup**, **Pieces**, **BoardWord**, **Round**, **Piece**, **BoardSetup**, **AbstractRound**, **AbstractBoardSetup**, **BoardPiece**, **BoardPieces**, **BoardSetup**, **Pieces**. The diagram uses standard UML notation for classes, inheritance (solid arrows), and associations (dashed arrows).

Plantuml Integrations with other tools

Plantuml How to integrate with Eclipse?

How to improve it?

- If you want to support other file types, you can implement a new extension to do so. You can have a look at [the current xcore implementation](#).

Calling PlantUML from Java

You can easily integrate **PlantUML** with your own code by adding *plantuml.jar* in your classpath.

Calling PlantUML from Java

PNG generation from a String

If your diagram description is stored in a `String`, you can use the `SourceStringReader` class to generate some PNG file.

```
import net.sourceforge.plantuml.SourceStringReader;
OutputStream png = ...;
String source = "@startuml\n";
source += "Bob -> Alice : hello\n";
source += "@enduml\n";

SourceStringReader reader = new SourceStringReader(source);
// Write the first image to "png"
String desc = reader.outputImage(png).getDescription();
// Return a null string if no generation
```

Calling PlantUML from Java

PNG generation from a File

If your diagram description is stored in a `File`, you can use the `SourceFileReader` class to generate some PNG file.

```
File source = ...;
SourceFileReader reader = new SourceFileReader(source);
List<GeneratedImage> list = reader.getGeneratedImages();
// Generated files
File png = list.get(0).getPngFile();
```

Calling PlantUML from Java

SVG generation from a String

If your diagram description is stored in a `String`, you can use the `SourceStringReader` class to generate some SVG file.

```
String source = "@startuml\n";  
source += "Bob -> Alice : hello\n";  
source += "@enduml\n";  
  
SourceStringReader reader = new SourceStringReader(source);  
final ByteArrayOutputStream os = new ByteArrayOutputStream();  
// Write the first image to "os"  
String desc = reader.generateImage(os, new FileFormatOption(FileFormat.SVG));  
os.close();  
  
// The XML is stored into svg  
final String svg = new String(os.toByteArray(), Charset.forName("UTF-8"));
```
